

# Advanced Programming in Computational Intelligence in Games

Summer

(in German: Advanced Programming in Computational Intelligence in Games )

**Module-ID: FIN-INF-120495**

| Abbreviation | Credit Points | Semester | Term           | Duration   | Language | Level  |
|--------------|---------------|----------|----------------|------------|----------|--------|
| AP-CIG       | 6             | Summer   | starting at 1. | 1 Semester | english  | Master |

|                                     |                                                                                                                                                                                                                           |

**Intended learning outcomes:**

Students ...

- carry out a large programming project using the concepts from the theoretical part of the course.
- have a full understanding of the algorithms of computational Intelligence in Games.
- learn to develop new ideas and apply them to new problems in the context of AI and Games.
- learn to program the methodologies from the lectures in teams.

**Content:**

This course addresses the basic and advanced topics in the area of computational intelligence and games and contains three parts: Part 1 addresses the basics in Evolutionary Game Theory (EGT). In this part you will learn about simple games such as scissors/rock/paper and the focus on the strategies for playing games. Part 2 is about learning agents, and we focus on reinforcement learning mechanisms. There are three questions for games:

- How can we use the information from a search mechanism to learn?
- How can we use reinforcement learning to find for a better strategy?
- How can we use reinforcement learning as a search mechanism?

The application is on board games. Part 3 contains the advanced topics in games and artificial intelligence How can we consider physical constraints of a spaceship while moving in an unknown terrain. Other topics are Monte Carlo Tree Search, Procedural Content Generation, Decision Making and Multi-Objective Learning.

**Workload:**

56 contact hours + 94h self study

| Pre-examination requirements: | Type of examination:                                                                                                                                                               | Teaching method / lecture hours per week (SWS):                                                       |
